

### Adaptive

1. It has been discussed to add Google Pay as a new method for payment.
2. Adding Google Pay as an external actor interacting with the system.
3. Payment declined because of “suspicious movements with your card” if users are not logged with a google account but still pay with this method.
4. Cannot test every login-payment method combination.
5. Obviously can't control an external actor.

### Corrective

1. Some clients presented complaints about being hacked.
2. Asking for longer passwords when signing up and sending emails to notificate the need to change the actual password.
3. The DB may be overloaded or have a not sufficient number of chars for the passwords.
4. Every 'older' user may have to update the old credentials.
5. Reasonably I need more characters to have more complex passwords.

### Perfective

1. The colour of the text on the buttons on the lateral panels is not distinguishable from the background.
2. Change the text colour from yellow to black, on a grey background.
3. When clicked the colour of the buttons turn dark grey, causing again the problem of not being able to read the text on the button.
4. Reasonably I'll test by looking at the new interface, not by clicking and testing the actual behaviour of the button.
5. Obviously, changing colours may cause other things to be unreadable.

### Preventive

1. Receipts may be lost or found in spam.
2. Asking to add a verified e-mail address or a backup one.
3. Sending the double the amount of e-mail may cause the system to be slower.
4. Cannot test with a big number of requests at the same time.
5. Reasonably it will take more time to elaborate more e-mails.
